TRIBHUVAN UNIVERSITY	Exam.	RAIL BO	Back	
INSTITUTE OF ENGINEERING	Level	BE	Full Marks	80
vamination Control Division	Programme	BCE	Pass Marks	32
2079 Ashad	Year / Part	11/11	Time	3 hrs.

Subject: - Theory of Structure (CE 551)

- Candidates are required to give their answers in their own words as far as practicable.
- Attempt All questions.
- The figures in the margin indicate Full Marks
- ✓ Assume suitable data if necessary
- 1. a) Explain how structure can be classified based on the materials used for their construction and structural functions.
 - b) Derive an expression for strain energy stored in a rectangular beam due to shear force. [6]

[4]

[6]

[8]

[8]

c) Find vertical deflection of joint C of truss. Assume all members have the same axial rigidity.

 a) Using moment area method, calculate slope at supports and deflection at the point of application of load. Take EI to be constant.

b) Determine the deflection and rotations at hinge B using conjugate beam method. El is constant throughout.

23

3. a) Draw ILD for SF and BM at section C of the given beam and using influence line concept, determine bending moment at C for the given loading.

b) Draw ILD for the member force of the members 2-10, 2-11 and 10-11 of the truss shown in the figure below.

- a) Derive an expression for calculating the horizontal distance from left support to crown
 of an parabolic three hinged arch whose supports are not placed at same level.
 - b) Calculate bending moment, normal thrust and radial shear developed at a section at 20 m from the left support in the three hinged parabolic arch given below. Also calculate the bending moment at the same section using ILD and verify your answer.

- .5. a) How will you determine the shear force at a section in a simply supported beam subjected to a couple moment at the center, using the concept of ILD? Support your answer with an example.
 - b) A suspension bridge having span of 200 m and central dip of 15 m has two three hinged stiffening girders supported by two cables. The dead load is 15 kN/m throughout the span and in addition, it supports three point loads of 150 kN each placed along the centerline of the roadway and dividing the span into four equal parts. Calculate the maximum tension in the cable and also draw shear force diagram for the

girder.

Subject: - Theory of Structures II (CE 601)

✓ Candidates are required to give their answers in their own words as far as practicable.

✓ Attempt All questions.

✓ The figures in the margin indicate Full Marks.

✓ Assume suitable data if necessary.

- 1. a) Explain the physical significance of flexibility and stiffness matrices with suitable examples.
 - b) In the beam ABC, support 'B' settles by λRe units. Find reaction Rc using castigliano's theorem.

c) Determine reactions at A, using Force method.

2. a) Find the BM at point D for the given two hinged parabolic arch. Take $Ix = Ic \sec\theta$.

b) Use consistent deformation method to draw the BM diagram of the given frame.

[10]

[10]

[6]

[4]

[6]

3. Analysis the given frame using stiffness matrix method.

[12

[6]

[10]

4. a) Draw the BMD for the given beam using slope deflection method.

b) Explain the principle of moment distribution with example.

5. a) Draw ILD for the shear at section 1-1 of the propped cantilever beam given in figure,

b) Evaluate the collapse load for the given frame.

Subject: - Theory of Structure I (CE 551)

Candidates are required to give their answers in their own words as far as practicable.

Attempt All questions.

The figures in the margin indicate Full Marks.

Assume suitable data if necessary.

a) Explain principle of superposition with necessary sketch and examples. 1.

- b) A cantilever beam of length 8 m having circular cross section of diameter 20 cm is subjected to a load of 15 kN and a twisting moment of 8 kNm at its end. Calculate the strain energies due to bending and torsion. Assume necessary data.
 - c) Using virtual work method, Calculate horizontal displacement at joint C of the given truss. Take AE to be constant.

All dimensions are in m

2. a) Calculate vertical deflection at free end of the given overhanging beam using moment area method. Take EI to be constant.

b) Find the slope at A and deflection at C, using conjugate beam method for the given [10] beam. Take EI is constant.

3. a) Four-wheel loads of 30kN, 80kN,60kN and 30kN as shown in figure move from right to left on a simply supported beam of span 20m. Calculate absolute maximum bending moment that can be expected in the beam.

[6]

[4]

[6]

[6]

[7]

J Draw influence line diagram for members L_0U_1, L_0L_1 and U_2L_2 when unit load moves

- 2 Prove that the bending moment developed at any section of a three hinged parabolic arch loaded with udl over the entire span is zero.
- J left support. loaded with two point loads of 20 kN and 30 kN at a distance of 3 m and 7 m A parabolic 3-hinged arch has a span of 20 m with a central rise of 5 m. The arch is respectively, from the left support. It also carries a UDL of 25kN/m over right half of the span. Determine the bending moment, normal thrust and radial shear at 5m from
- 2 How will you determine the bending moment at a section when a load train P1,P2,P3,P4 and P5 move in a simply supported beam. Assume all missing data
- 9 A suspension bridge has a span of 150 m attached with two 3 hinged stiffening girders acts on the right-half of the span. Determine the shear force and bending moment at a supported by two cables. The central sag in the cable is 15 m. The UDL of 15 kN/m distance of 50 m from the right end. Also, determine the maximum tension in the cable. Assume, the road has a width of 5m.

✓ Candidates are required to give their answers in their own words as far as practicable.

✓ Attempt <u>All</u> questions.

✓ The figures in the margin indicate Full Marks.

✓ Assume suitable data if necessary.

- 1. a) Explain about the non-linearity in structures with its types.
 - b) Calculate strain energy due to bending of the given beam.

c) Calculate the vertical deflection at joint E using virtual work method due to the following effects:

(i) loads given

(ii) inclined members are heated by 20°C

(iii)horizontal members are too short by 5 mm Take $E = 2 \times 10^5$ N/mm², A = 1000 mm² and $\alpha = 12 \times 10^{-6}/^{\circ}C$

 a) Determine the deflection at C and rotations at A and C using Moment Area Method. EI is constant throughout.

b) Determine the slopes and deflections at C and D using conjugate beam method. The beam is made up of steel and is 300 mm wide by 400 mm deep. Neglect self-weight.

[8]

[8]

[4]

[4]

[8]

3. a) Determine the maximum force of member U₂L₃ of the truss shown in figure below, when UDL 20 kN/m longer than the span traverse along the span of girder.

b) For the overhanging beam determine the maximum positive and negative bending moment and shear forces at 'D' due to the three concentrated loads as shown in figure, which moves from left to right.

4. A symmetrical circular arch is shown in the figure below. Calculate the values of normal thrust, radial shear and bending moment at a section 20 m from the left support. Also draw BMD for the given arch.

- 5. a) Explain how you obtain maximum bending moment at a section when a train of loads shorter than a span move in a simply supported beam of length 'l'.
 - b) A suspension bridge of 100 m span has two three hinged stiffening girders supported by two cables having a central dip of 8 m. The roadway has a width of 6m. The dead load on the bridge is 8 kN/m² while the live load is 12 kN/m² which acts on the left-half of the span. Determine the shear force and bending moment in the girder at 25 m from the left end. Find also the maximum tension in the cable for position of live load.

- 1. a) Enunciate the principle of superposition and explain with suitable example.
 - b) A simply supported beam carries a point load W at mid span L. The middle one third portion of length has flexural rigidity 2 EI and rest two third portion has flexural rigidity EI. Determine the maximum deflection and slope at supports. Use conjugate beam method.
- 2. a) A rectangular beam 25cm×50cm (b×d) is simply supported on a span of 6 m and carries a central load of 100 KN. Calculate the strain energy due to shear. Neglect self weight of the beam. Take $E = 2 \times 10^6$ kg/cm² and $G = 0.85 \times 10^6$ kg/cm².
 - b) Draw influence line diagram for forces in members BC and BG and determine maximum force in member BC when uniformly distributed load 6 KN/m of length 8 m moves.

- 3. a) Define real work and virtual work for deformable structures.
 - b) A three hinged circular arch has span 40 m and rise 5 m. Make a sketch of the arch and given the equation to it. It carries a concentrated load 60 KN at 8 m from the right support and uniformly distributed load 4 KN/m over left haif portion. Determine bending moment, radial shear force and normal thrust at a section 10 m from the left support.
- 4. a) What is neutral point in an influence line diagram of an arch? Determine it for a three hinged arch for an ILD for bending moment diagram at a section.
 - b) Determine the vertical defection of joint E due to the increase in temperature of 20°C of member CD and member CE being 5 mm too long.

Take E = 200 KN/mm² $\alpha = 12 \times 10^{-6}/^{\circ}C$ Area = 1000 mm² for all members [4]

[12]

[4]

[12]

[4]

[12]

[6]

5. a) Define influence line diagram and explain how it is different from other structural quantity diagrams like bending moment diagram, shear force diagram etc.

8

b) A suspension cable having central dip 15 m supports a three hinged stiffening girder 150 m long which supports point loads 180 KN at 50 m from left support and 120 KN at 30 m from the right support. The dead load of the girder is 5 KN/m. Determine Bending moment and shear force at a section 30 m from the left support. Also determine the maximum tension in the cable and length of cable.

Subject: - Theory of Structure I (EG562CE)

- \checkmark Candidates are required to give their answers in their own words as far as practicable.
- ✓ Attempt any *Five* questions.
- ✓ The figures in the margin indicate *Full Marks*.
- ✓ Assume suitable data if necessary.
- 1. a) What is strain energy? Explain with an example real work method to calculate the deflection of a beam. [1+3]
 - b) Determine the vertical deflection at point D of the frame loaded as shown in figure below: [12]

- 2. a) State and derive formulae for conjugate beam method.
 - b) Determine vertical deflection at D of the beam shown in figure below by using moment area method. Take EI to be constant. [10]

3. Determine the deflection at E of the pin-jointed Truss shown in figure below by using Virtual work method. [16]

4. a) Draw influence line diagram for shear force at C of the overhanging beam shown in figure below. [6]

- b) Determine maximum negative and positive bending moment at section C of the overhanging beam shown in Q.N. 4a when uniform distributed load of intensity 15 KN/m of length 4 m rolls over the beam from left to right. [10]
- 5. a) Derive the formula for determination of neutral point in influence line diagram of bending moment for a given section in a three hinged parabolic arch. [6]
 - b) A three hinged parabolic arch having span 80 m and central rise 8 m is loaded as shown in figure below. Determine bending moment, normal trust and radial shear force at section D. [10]

6. A suspension cable bridge has a three hinged girder supported by two cables. The roadway is 6 m wide. The girder has its self weight 5 KN/m². The live load consists of two concentrated loads 200 KN at 20 m from left support and 150 KN at 10 m right from the 200 KN load. The span is 120 m and central dip is 12 m. The live loads are acting at the central of the girder. Determine shear force and bending moment at section 25 m from left support of the girder. Also determine required cross sectional area of the cable if the allowable tensile stress of cable material is 120 N/mm². [16]

Year / Part	II / II	Time	3 hrs.

Subject: - Theory of Structure (CE551)

✓ Candidates are required to give their answers in their own words as far as practicable.

✓ Attempt All questions.

✓ The figures in the margin indicate *Full Marks*.

✓ Assume suitable data if necessary.

- 1. a) Use influence line diagram to determine most critical position of a stretch of uniform distributed load and a set of concentrated forces to give maximum bending moment at a given section of a simply supported beam. Assume the length of the uniform distributed load and the set of concentrated forces to be less than the span of the beam.
 - b) Calculate horizontal displacement of the roller support and angular displacement of the fixed hinge of the given portal frame by using unit load (virtual work) method. Express the result in terms of sectional stiffness EI.

- 2. a) Define strain energy and explain with examples the difference between gradually and suddenly applied direct loads. Derive the expression for strain energy due to shear force in a beam in bending.
 - b) A simply supported beam of span 4 m with an overhang of length 2 m on right side of the beam is loaded in the span with uniform distributed load of intensity 2 kN/m. The overhang is loaded with a concentrated force of magnitude 3 kN at the free end. Calculate the deflection of the free end of the overhang and slope at the support. Use conjugate beam method.
- 3. a) Explain the characteristics of structural mechanics and describe with suitable examples what are the two basic approaches of structural analysis.
 - b) Draw a simple rectangular plane truss having span of four equal bays and with horizontal, vertical and inclined members. Show required dimensions of the truss. Draw influence line diagrams for forces in one of the each horizontal vertical and inclined members. Consider the given truss is deck type.

[6]

[12]

[6]

[12]

[6]

[12]

- 4. A three hinged symmetrical parabolic arch of span 20 m and rise 4 m is with a point load of magnitude 4 kN at 4 m distance from the left hinge. First, draw influence line diagram (ILD) for bending moment (BM), radial shear (RS), and normal thrust (NT) for the section where the point load is and then calculate the values of BM, RS and NT at the section using the ILDs. Also check these values of internal forces at the section by first principle using equilibrium equations.
- 5. Determine the cross sectional area required for the cable loaded as shown in figure below if the permissible tensile stress of the cable material is 1500 N/mm². The self weight of the girder is 10 kN/m. Draw bending moment diagram of three hinged stiffening girder and also calculate the length of cable.

	Candidates are required to give their answers in their own words as far as practicable. Attempt <u>All</u> questions. The figures in the margin indicate <u>Full Marks</u> . Assume suitable data if necessary.	
Ι.	a) Explain with suitable force-displacement diagram, the elastic, inelastic, linear and non-linear behaviour of structure.	[4]
	b) A bar of 2 cm diameter and of length 125 cm is supported rigidly in the vertical position at the top and is provided with a holow falling mass and a collar at the bottom which supports a spring 10 cm long. Find the stress developed if the falling mass is 4 kg and it fals from the height of one meter measured from the collar top. Take $g = 9.81 \text{ m/s}^2$, stiffness of the spring (k) = 40 KN/m and E = 210 GN/m ² .	[6]

- 2. a) Use virtual work method to determine the mid-span deflection for a simply supported steel beam of depth 300 mm carrying a superimposed udl of 20 KN/m over a span of 5 m, if the temperature of the top surface is 40°C and at bottom surface is 30°C. Assume the temperature to vary linearly over the depth of the beam. Take coefficient of thermal expansion = 11.7×10^{-6} /°C E = 210 GN/m² and moment of inertia = 15000 cm^4 .
 - b) Using influence line diagram prove that for a uniformly distributed load shorter than span, the bending moment at a section is maximum when the position of the load is such that the section divides the span and the load in the same ratio.
- 3. a) Draw influence line diagram for bending moment and shear force at mid span of the beam of span 20 m and determine bending moment and shear force at that section due to the loads shown in figure using the influence line diagram.

b) Draw influence line diagram for forces in member FG and BC of the truss shown in figure below and determine maximum forces in these members when a single concentrated load 100 KN rolls over the span of the truss.

[10]

[5]

[10]

[5]

4. In the three hinged parabolic arch loaded as shown below, determine reactions at supports and also find bending moment, normal thrust and radial shear force at section D 15 m far from A. Draw influence line diagram for bending moment and normal thrust at that point [15] and again determine the bending moment and normal thrust at D by using the ild.

5. a) Determine the deflection at mid span of a simply supported beam subjected to uniformly distributed load w KN/m on the whole span by moment area.

b) Determine the vertical deflection and rotation at free end C of the overhanging beam ABC loaded as shown in figure below by using conjugate beam method.

- 6. A cable is suspended and loaded as shown in figure. Calculate:
 - a) Length of cable
 - b) Horizontal component of tension in cable
 - c) Magnitude and position of maximum tension occurring in cable

- Subject: Theory of Structure (CE551)
- ✓ Candidates are required to give their answers in their own words as far as practicable.
- Attempt <u>All</u> questions.
- The figures in the margin indicate <u>Full Marks</u>.
- ✓ Assume suitable data if necessary.
- a) Explain with an example, how would you use method of superposition in deforming deflections. Also, explain why it is necessary to determine deflections in the design of a structure. [4+2]
 - b) Find slopes at supports and deflection at E of the beam given in figure below. Use conjugate beam method for deflection and slope calculations.

- 2. a) Define virtual work method and real work method with neat sketches. What are limitations of real work method?
 - b) Two plastics bars as shown in figure below are to absorb the same amount of energy delivered by the axial forces. Neglecting stress concentrations compare the stresses in two bars.

- 3. a) Use influence line diagram to determine most critical position of a stretch of uniform distribution load to give maximum bending moment at a given section of a simply supported beam. Assume the length of the uniform distributed load less than the span of the beam.
 - b) Determine R_A, R_B, S.F. at C and B.M at 'C' of the given structure as shown in figure below using influence line diagram concept.

4. a) Determine B.M normal thrust, Radial shear at point D of circular arch as shown in figure below. Also draw bending moment diagram.

- b) Explain different types of arches used in various Civil Engineering structures.
- 5. a) Explain with a simple example the steps involved in determining displacement of a point in a structural system applying unit load method.
 - b) A cable is hanging from two points A and B, 80 m apart horizontally, left end A being lower than the right end by 10 m. It supports a uniform load of 1.5 KN/m along the horizontal span. Determine:
 - i) The position of the lowest point if it sag is 7.5 m

ii) Length of the cable

iii) Horizontal tension and tension at the two ends.

Subject: - Theory of Structure (CE551)

- Candidates are required to give their answers in their own words as far as practicable.
- Attempt All questions.
- The figures in the margin indicate Full Marks.
- Assume suitable data if necessary.
- a) Explain two basic approaches of structural analysis. Also explain briefly the non-linearity in 1. structural analysis.
 - b), A three-hinged symmetrical circular arch is of 12 m span and 4 m rise. Draw influence line diagram for bending moment, radial shear and normal thrust in the section at distance of 3 m from the left support. Use the diagrams to determine these internal forces in the section when the left half of the span is loaded with a uniformly distributed load of intensity 20 kNm⁻¹ and a vertical concentrated load of magnitude 40 kN at a distance of 3 m from the right support.
- Write down the formula for determination of total strain energy due to axial force, bending 2. a) moment, shear force and torsion in a structural system. Derive the expression for energy due to shear force in an element of a structural system.
 - Using conjugate beam method, calculate slopes at the supports and at the points beneath the b) loads for the given simply supported beam and also calculate the deflections of the points beneath the loads. Take $EI = 3.36 \times 10^{11} \text{ kNmm}^2$.

- 3. a) State and prove moment area theorems for determining deflections at any point of a beam.
 - b) Calculate the displacements in two orthogonal directions and also the slope at the free end of the given frame due to the temperature effect as shown. Take EI to be constant for the frame. [10]
- 4. a) Explain with necessary sketches the steps involved in determining bending moment, radial shear and normal thrust in a three hinged arch by graphical method.
 - Draw influence line diagram for the members LC, LK and LD when the load moves in the b) lower chord of the given truss as shown in figure. [10]

- 5. a) Explain with neat sketches tower structures as well as wind cables and ties.
 - b), Use influence line diagrams to determine reactions at the supports, bending moments and shear forces beneath the applied forces in the beam shown in Question No. 2(b).

Subject: - Theory of Structures I (CE551)

✓ Candidates are required to give their answers in their own words as far as practicable.

✓ Attempt any All questions.

✓ The figures in the margin indicate Full Marks.

✓ Assume suitable data if necessary.

1. a) Differentiate between linear and non-linear behavior of structures and explain their uses in theory of structures.

[6]

[10]

- b) A cable is supported at two points 20 m apart at the same level. It is used to support three equidistant loads, first load is 40 kN, second is 30kN and third is 20 kN. The central dip of the cable is 0.96 m. find the length of the cable required and its sectional area if the safe tensile stress is 250 kN/mm². Also give the geometry (shape and dip) of the cable when it is hanging only with its weight (without the given loads).
- 2. a) Define and explain strain energy. Use strain energy method to show the deflection due to shear in an ordinary beam can be neglected in comparison to the deflection due to bending. Assume ratio of Young's modules to modules of rigidity to be 2.4 and shape factor for shear 1.2.
 - b) Determine, using virtual work method, the vertical deflection of joint L₂. The L/A values for diagonal and vertical members are 12 mm⁻¹ and for horizontal members are 6 mm⁻¹. Take $E = 200*10^3$ N/mm² for all members. (i) Find vertical deflection due to loads as shown in figure (ii) Find the additional deflection if the top boom is subjected to a temperature rise of 20°C. Take the value of coeffic. of linear expansion (α) = 10.8*10⁻⁶/°C.

- 3. A horizontal girder of steel having uniform section 14 m long is simply supported at its end. It carries concentrated loads of 120 kN and 80 kN at two points 3 m and 4.5 m from the two ends supports respectively. Calculate the deflection and slopes of the girder at the point under the loads using moment area method. Take I = $16*10^8$ mm⁴ and E = 210kN/mm². Verify the results using conjugate beam method. Also find magnitude and location of the maximum deflection in the beam.
- 4. A three hinged symmetrical parabolic arch has a span of 18 m and rise of 3 m. It carries a concentrated load of 80 kN at 4.5 m from the right support and a distributed load of 5 kN/m over half portion. Determine the moment, thrust and radial shear at each 3 m interval and draw their diagrams on horizontal 'X' axis for the arch.

[8]

[8]

[16]

[16]

5. a) For the overhang beam determine the maximum positive and negative bending moment and shear force at D due to the three concentrated loads as shown in figure which moves in either directions.

b) A suspension cable is suspended from two piers 200 m apart, left support being 5 m above the other. The cable carries a uniformly distributed load of 15 kN/m in plan and has its lowest point 10 m below the lower support. The ends of the cables are attached to saddles on rollers on top of piers and the backstays which may be assumed straight are inclined at 60° to the vertical. Determine: (i) The length of cable (ii) Maximum tension in cable and (iii) Maximum thrust and moment on pier.

- ✓ Assume suitable data if necessary.
- 1. a) Enunciate the two theorems from the moment area method for the determination of displacements of beam and explain it with a simple example.
 - b) A three-hinged symmetrical circular arch is of 12m span and 4m rise. Draw influence line diagram for bending moment, radial shear and normal thrust in the section at distance of 3m from the left support. Use the diagrams to determine these internal forces in the section when the left half of the span is loaded with a uniform distributed load of intensity 20 kNm⁻¹ and a vertical concentrated load of magnitude 40 kN at a distance of 3m from the right support.
- 2. a) Write down the formula for determination of total strain energy due to axial force, bending moment, shear force and torsion in a structural system. Derive the expression for energy due to shear force in an element of a structural system.
 - b) Using conjugate beam method, calculate slopes at the supports and at the points beneath the loads for the given simply supported beam and also calculate the deflections of the points beneath the loads. Take $EI = 3.36 \times 10^{11} \text{ kNmm}^2$.

- 3. a) Explain with necessary sketches the steps involved in determining bending moment, radial shear and normal thrust in a three hinged arch by graphical method.
 - b) Calculate the displacements in two orthogonal directions and also the slope at the free end of the given frame due to the temperature effect as shown. Take EI to be constant for the frame.

- 4. a) Use influence line diagram to determine most critical position of a stretch of uniformly distributed load to give maximum bending moment at a given section of a simply supported beam. Assume the length of the uniformly distributed load less than the span of the beam.
 - b) Use strain energy method for the given frame to calculate the vertical displacement of the point with load 500 kN. The frame is made of steel rod Φ 100mm. Take $E = 2 \times 10^5 \text{N/mm}^2$.

- 5. a) Determine the geometry of the shape and calculate the length required for a high tension line between any two towers. Take the span between the two towers and the weight per unit length of the cable to be ℓ and γ respectively.
 - b) Use influence line diagrams to determine reactions at the supports, bending moments and shear forces beneath the applied forces in the beam shown in Question No. 2(b).
- 6. a) Explain with a simple example the steps involved in determining the displacement of a point in a structural system applying unit load method.
 - b) A symmetrical suspension bridge with a three hinged stiffening girder of span 120m and having a central dip of 12m is loaded with two point loads of magnitude 240 kN and 300 kN at a distance 25m and 80m respectively from the left end. Draw bending moment diagram for the girder and also calculate bending moments at the distances 25m, 40m and 80m from the left support.

01 TRIBHUVAN UNIVERSITY INSTITUTE OF ENGINEERING Examination Control Division 2065 Chaitra

Exam.	Regular/Back		
Level	BE	Full Marks	80
Programme	BCE	Pass Marks	32
Year / Part	П/П	Time	3 hrs.

Subject: - Theory of Structures I

- Candidates are required to give their answers in their own words as far as practicable.
- Attempt any *Five* questions.

b) Calculate the vertical deflection of free end D of the beam loaded as shown in fig-2 by using virtual work method. Take EI as constant through out.

2. a) Determine the slope at A and B and deflection at D of the beam loaded as shown in fig-3 using moment area method. Take EI as constant.

b) Determine the rotation at A and deflection at C in the overhanging beam shown in fig-4 by using conjugate beam method.
 [8]

3. a) Find the maximum bending moment at C for the beam and loading as shown in fig-5. [8]

[8]

[8]

[8]

b) Draw influence line diagram for bending moment at F (5m right of A) and for the stress in the support BD of the structure shown in fig-6.

4. a) Draw influence line diagram and calculate the bending moment at mid span C for the beam shown in fig-7.

b) Draw influence line diagram for members U3L3 and L3L4 of the truss shown in fig-8.

- 5. A three hinged parabolic arch as shown in fig-9 is loaded with udl 2 KN/m on the left 8m length. Calculate
 - a) Direction and magnitude of reaction at supports.
 - b) The bending moment, normal thrust and radial shear at 4m from left end.
 - c) Draw bending moment diagram showing maximum positive and negative values.

6. a) A suspension cable of span L has its ends at the height h_1 and h_2 above the lowest point of cable. It carries a uniformly distributed load of w per unit run of the span. Show that the horizontal reaction at each end is given by $H - \frac{WL^2}{2(\sqrt{h_1} + \sqrt{h_2})^2}$.

b) A cable is stretched over a gap of 300m and carries uniformly distributed load of 300 kg/m horizontally. If the central dip is 1.5m. Calculate the maximum tension in the cable. Also find the length of cable.
